Homework 04

Exercise 1 (points = 32)

Determine whether the statements below are true or false. Do not explain.

- 1. 119 is a prime number.
- 2. 161 is a prime number.
- 3. 42k is an even number for any integer k.
- 4. For each integer n with $2 \le n \le 6$, $n^2 n + 11$ is a prime number.
- 5. The average of any two odd integers is odd.
- 6. For any real number x, if x * x >= 4, then x >= 2.
- 7. For any real numbers x and y, $x^2 2xy + y^2 >= 0$.

8. There exists an integer x, such that $(2x + 1)^2$ is even.

Exercise 2. (points = 8)

- Conduct a bit of research: Describe the formal definition of continuity for a real-valued function f at the point x.
- Provide the formal definition for f being discontinuous at x.

issue

To be constituous on point x, the function for must be defined at $x=\alpha$, $f(\alpha)$, also limit must be existed him f(x)=s one value, $\lim_{x\to a^+} f(x)=\lim_{x\to a^+} f(x)$, and $\lim_{x\to a^+} f(x)=f(\alpha)$.

To be discontinuous at (x), $\lim_{x\to a^+} f(x)=f(x)$, and $\lim_{x\to a^+} f(x)=f(x)$, and $\lim_{x\to a^+} f(x)=f(x)$, $\lim_{x\to a^+} f(x)=f(x)$.

Exercise 2

- any ε > 0, there exists δ > 0 such that for all x, if |x c| < δ, then |f(x) f(c)| < ε
- There exists ε < 0, any δ ≤ 0 such that for some x, |x c| < δ and |f(x) f(c)| ≥ ε

Exercise 3 (points = 15)

Prove the following proposition: An even number multiplied by an integer is an even number.

Check "Key points for proof-writing" above.

Exercise 4 (points = 15)

Prove the following proposition: An odd number multiplied by an odd number is an odd number.

Check "Key points for proof-writing" above.

```
Exercise 4
(2n+1)^2
Proof
suppose ne have two odd number (2)41).
 (2)(+1)2 is equal to 4x2+472+1. By definition,
 472,471 is an even number and by adding
 1, it will be an odd humber
 QEP.
```

Exercise 5 (points = 15)

We say an integer is a perfect square if it can be expressed as a square of some integer. For example, 81 is a perfect square; 80 is not.

Prove the following statement: there is a perfect square that can be written as a sum of two other perfect squares.

Check "Key points for proof-writing" above.

Exercise 5

proof: for some k, r from integer, assume there is a perfect square k^2 and r^2. Then
the sum of two perfect squares is k^2 + r^2. We can find this structure from
Pythagorean Theorem. In Pythagorean Theorem, a^2 + b^2 = c^2, so there exists a
perfect square that can be written as a sum of two other perfect squares.

O F D

Prove	the following statement: there is a perfect square that
can b	the following statement: there is a perfect square that e written as a sum of two other perfect squares.
. Pro	of.
-	suppose in is a perfect square, à is a perfect square,
	and in is a perfect square, we need to show n = m+3
	· STUCE a is a perfect squares u = a2 for some real number
	· Since i Ts a perfect square, i= b 2 for some real number b
	· Since m is a ferfect square, m= c = for some real number c
	· If $a=5$, $b=3$, and $c=4$ then we note
	$a^2 = 5^2 = 25 = 3^2 + 4^2 = 9 + 16 = 6^2 + 6^2 = 6 = 40$
	· We note that $a^2 = b^2 + c^2$ holds in this case
	. Thus, there must be at least one perfect square that
	can be written as a sum of two other perfect squares.
·QED	Teste see, the see all the sell

Exercise 6 (points = 15)

Suppose a \in Z. Prove: If a is an odd integer, then a^2+3a+5 is odd.

Check "Key points for proof-writing" above.

Issue (Not an issue. Student please contact me)

Exercise 6 (points = 15)

Suppose $a \in Z$. Prove: If a is an odd integer, then $a^2 + 3a + 5$ is odd. Check "Key points for proof-writing" above.

Answer:

- Let a be an odd integer.
- 3 and 5 are odd integers.
- The sum of three odd integers is always odd, we can conclude that a^2 + 3a + 5 is odd.

Exercise 6.

proof.

- Suppose a is an odd integer, then a^2 + 3a +5 is odd.
- Since a = 2k+1 for some integer k.
- $(2k+1)^2+3(2k+1)+5=4k^2+4k+1+6k+3+5=4k^2+10k+9=2(2k^2+5k+4)+1$, which shows that if a is an odd integer, then a^2 + 3a +5 is odd.
- QED.

Solution

- (1) False
- (2) False
- (3) True
- (4) True
- (5) False
- (6) False
- (7) True
- (8) False

f is continuous at x if

$$\forall \epsilon > 0, \exists \delta > 0, \forall y, |y - x| < \delta \rightarrow |f(y) - f(x)| < \epsilon$$

f is discontinuous at x if

$$\exists \epsilon > 0, \forall \delta > 0, \exists y, |y - x| < \delta \land |f(y) - f(x)| \ge \epsilon$$

Enercise 3 Proof Suppose n is an even number and k an integer. Since n is even, n= 2k' for some integer k'. Thus, n·k = 2k'K Thus, N-K is even QED

```
Exercise 4
 Proof
   Suppose 1 and m are odd numbers.
   Since I and m are odd, N=2k+1 and m=2k+1 for some integers k, k'
   n·m=(2k+1)(2k+1) = 4kk+2k+2k+1
    = 2 (2kk'+ k+K')+1
    Thus, n.m is odd
```

QED

Eaercise 5

Proof

Let a = 9 and b = 16

Then, a and b are two perfect squares

atb = 25 is also a perfect square

Thus, there exists a perfect square that can be written as a sum of two other perfect squares.

QED

```
Exercise 6
 Proof
    Suppose a is an odd integer.
    az 2k+1 for some integer k.
    a^{3}+3a+5=(2k+1)^{2}+3(2k+1)+5=4k^{2}+4k+1+6k+3+5
    =4k^2+10k+9=2(2k^2+5k+4)+1
    Thus, Q2+3at5 is odd
```

QED.
